

M-FR1

REMOTE CONTROLS

We are expanding our range of compatible remote controls for garage doors and access barriers with the new M Series. We are adding the **M-FR1**, a remote control capable of automatically and wirelessly duplicating the frequency and code.

- Duplicate **95%** of fixed codes and **over 40 rolling code brands** onto any of the buttons.
- **Wireless** code and frequency capture with no need for adjustments. Each button uses different codes and frequencies.
- **Operating** frequency: 433-868 Mhz.

INSTANT DUPLICATION

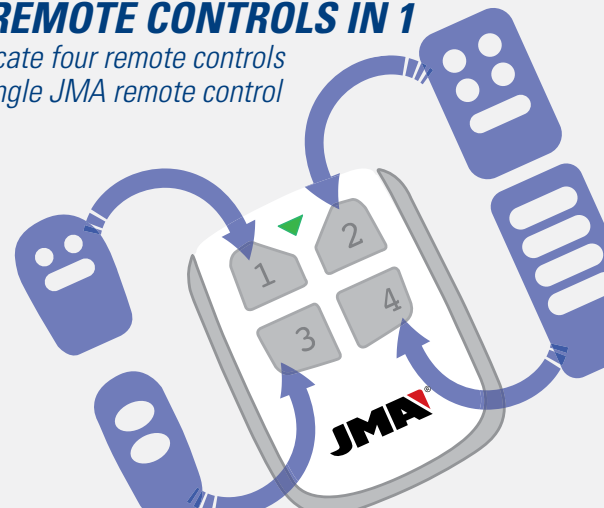

DUPLICATE IN TWO SIMPLE STEPS.

1. Remote control preparation.
2. Transmission of information from the original remote control.

4 REMOTE CONTROLS IN 1

Duplicate four remote controls on a single JMA remote control

DUPLICATION SEQUENCE

A. Rolling/fixed or unknown code

Press buttons 1 and 2 at the same time until the red LED starts to flash. Release and wait until it turns off.

Press the button you wish to save to. The red LED will light up.

Press the desired button on the original remote control and hold until the LED on the M-FR1 remote control turns green.

B. Known fixed code

Press buttons 1 and 3 at the same time until the red LED starts to flash. Release and wait until it turns off.

If the LED switches to red, it is a rolling code remote control and needs a second data set transfer.

If the green LED switches off after a while, the copy has been successful.

If the green LED starts flashing, the code has not been verified. We recommend starting the copy process again.

If the red LED starts flashing, the code has not been captured. We recommend starting the copy process again.

Press the desired button on the original remote control and hold until the LED on the M-FR1 remote control turns green.

If the green LED switches off after a while, the copy has been successful.

If the LED starts flashing red, the rolling code cannot be duplicated.
