

M-SP1B

REMOTE CONTROLS

We are expanding our range of compatible remote controls for garage doors and access barriers with the new M Series. We are adding the **M-SP1B**, a remote control capable of automatically and wirelessly duplicating the frequency and code.

- Duplicate **95%** of fixed codes onto any of the buttons.
- **Wireless** code and frequency capture with no need for adjustments. Each button uses different frequencies.
- **Operating** frequency: 433-868 Mhz.

INSTANT DUPLICATION

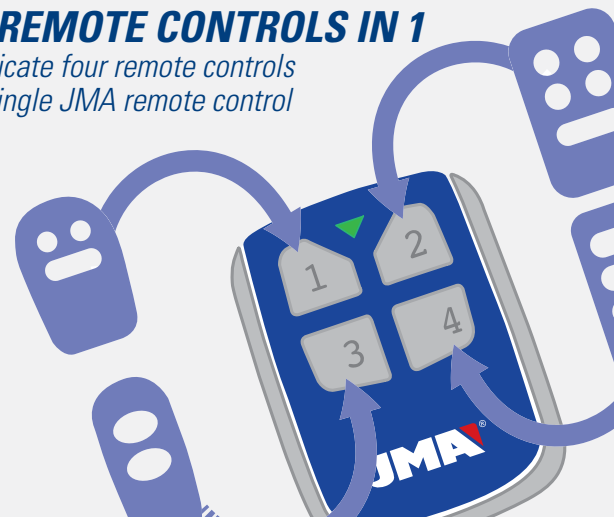

DUPLICATE IN TWO SIMPLE STEPS.

1. Remote control preparation.
2. Transmission of information from the original remote control.

4 REMOTE CONTROLS IN 1

Duplicate four remote controls on a single JMA remote control

DUPLICATION SEQUENCE

Press buttons 1 and 2 at the same time until the red LED starts to flash. Release and wait until it turns off.

Press the button you wish to save to. The red LED will light up.

Press the desired button on the original remote control and hold until the LED on the M-SP1B remote control turns green.

If the green LED switches off after a while, the copy has been successful.

If the LED starts flashing green, the code has been captured but not verified. We recommend starting the process again.

If the LED starts flashing red, the code has not been captured correctly. Try again but move the original remote control closer or further away.
